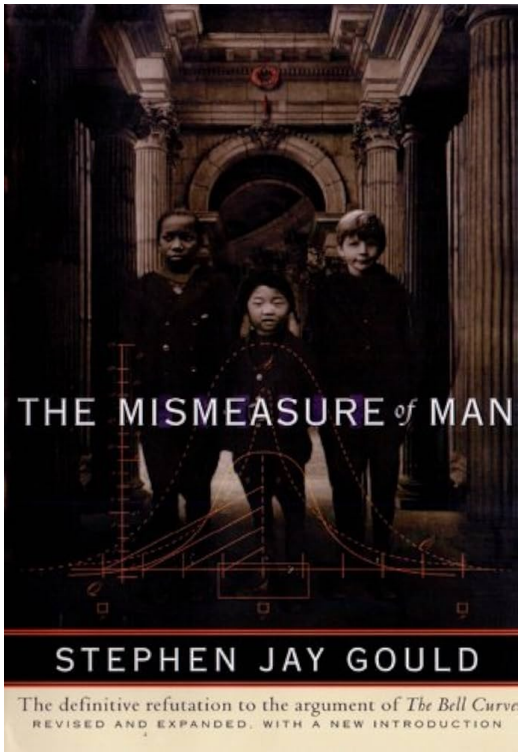
The Mismeasure of Man



By Stephen Jay Gould

Introduction

By Dick Lewontine

I believe in an abstract fashion to just argue it is all about the simple things to do with this occasion, some complex things which articulates to a Wonderful Life previously published for the first time in history to in fact Mismeasure of Man being published now as well first again, which together is the story of evolution and such simple stories to be told. Like that of Almon and Simone which is about their education together in a school and how it becomes a large construction of history and geography in that simple class – we then become The Man. Talk later.

I. The Current Political Situation in the World as Greatness

And so there are revolutionaries and there are politicians. They could succeed and win over common subjects of being pushed around and shoved around. So in fact they reach “Greatness”.

II. Old Histories of Man’s Greatness

The tribal chieftanship and his mis-deeds and his power.

III. A Long Argument Again

And so in fact there is a large architectural structure and that has many embellishments and many spandrels and foyeaurs and many freedoms and many gates and doors.

This becomes one long argument again and again I mean on man’s greatness.

IV. A Lecture (American Copy in Ohio)

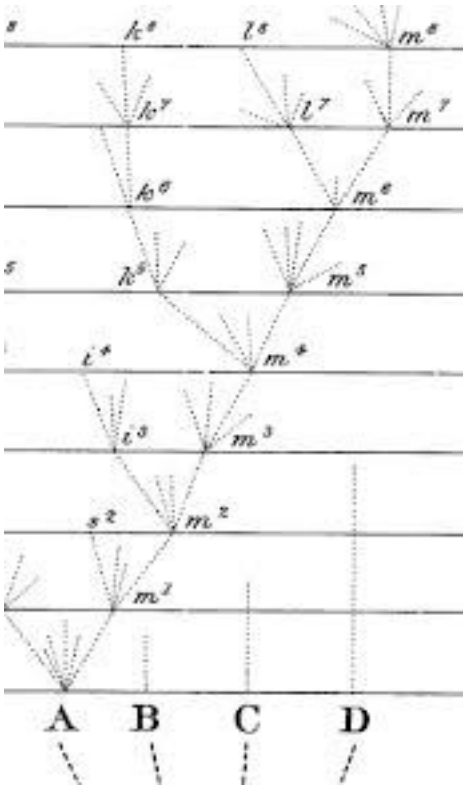
In fact then man has a long scope history and is also present history and is geographic developments of the long scope of Pangea and all this then is rain and such storms in the past which become a long process.

I also mean just articulate I – IV and study it as articulated – the great leader who then could be the leader in a revolt of tribes in the past which becomes then a process of envelopment of the one Great Man by in fact canoes and this long time’s arrow becomes evolutionary biology and its history of the success of Homo Sapien Sapien and how then man has different such histories from the Ape and this becomes Darwin and Darwinianism.

V. A Structuralism Applied to this Structure of Man

And so finally a structural causality of then the multiple levels which become a complex interaction of eco-systems with bio-systems and also many levels of paleontology and such long developments of history which makes man in fact the highest citizen and highest subject.

I mean all of this is structural multiple levels and I also mean in this Dick has proven along with Sirohi recently – that there is topoii and even topi and categories added to this analysis and it makes this structural level complex.



V. Articulating this Simple Darwinian Branch Again – Now this occasion I mean Man and his Whole Greatness

In fact m5 with k 7 and all together other ks and other ms is organised to reveal the structure of a walking upright man which has one level in in fact processes of walking and running and even organizing tools and weapons and in fact tribal histories all of which become complex proceses of the hands and its finger straightening by labouring and such transformations of his complexity and gradual brain development which then also means in one long scope – how today we are all human sapien and how in fact our greatness is also how to forage in the fridge for a bread and omlette to be made which then has in it a history of poultry and birds and all this means such complex developments of species and genera and man together like a falling Von Neumann sit which then is how man used to jump from canal to boat to another boat in hills and this then is nowadays just sitting and lecturing and talking in a talk show and this becomes our comforts and their difficult lives and how we are today such Greatness as in fact watching a old lecture on say political history in Greece and all of this then is man’s full history of Greatness.
